A RETROFIT REVOLUTION

Why deep retrofitting the UK is good for the planet and our pockets.
Existing UK housing is old and inefficient.

We are wasting money on energy we don't use and are set to miss the UK’s climate targets.

Smart policymaking can kickstart a retrofit revolution.
Today, retrofitting homes to a net zero standard is expensive.
One-off, short-term measures like the Green Homes Grant may help a few, but barely scratch the surface.
Instead we need a bold, long-term government strategy to drive down the costs of deep retrofits...
...and increase support from lenders such as the high street banks.
With the right package of support from government to incentivise deep retrofits and drive costs down, we can get to a tipping point – in a good way.
Then market forces will take over – and government support can be phased out.
Deep retrofits become easy. We will have entered a 'Retrofit Revolution' that benefits households, businesses and the planet.
Saving households and businesses billions on their energy bills, creating good jobs and ending fuel poverty, all while meeting ambitious climate goals.
Government support only needs to get us to the top of the hill.
Bankers for Net Zero calls on the UK government to seize the opportunity to kickstart a Retrofit Revolution.
